# What is programming

- An art more than a science (especially in python)
- Not about remembering function names (google, stack-overflow and cheat sheets are your friends !)
- Doing compromises often
- Dealing with technical debt
- Sometimes very frustrating

- Developers make mistakes
- A code is read a lot more often than written
- Developer time is a lot more expensive than CPU
- No pre-optimisation
- Productivity is decreasing (quickly) with project size
- Modularity is very important
